PRE-LAB01– Angular Basics: Submission Template

Nov 8, 2026

- **Advanced Dynamic Web Applications** · Download this template, fill in every section, save it as **PDF** named `Napukaw_John-Brent_Activity1.pdf`, and upload it with your project ZIP to the Canvas assignment.

Student Information

Field	Your entry
Full name	John Brent C. Napukaw
Student number	21006448
Section	WD-301
Date submitted	November 10, 2026

Environment Details

Copy these values from the output of `node -v`, `npm -v` and `ng version`.

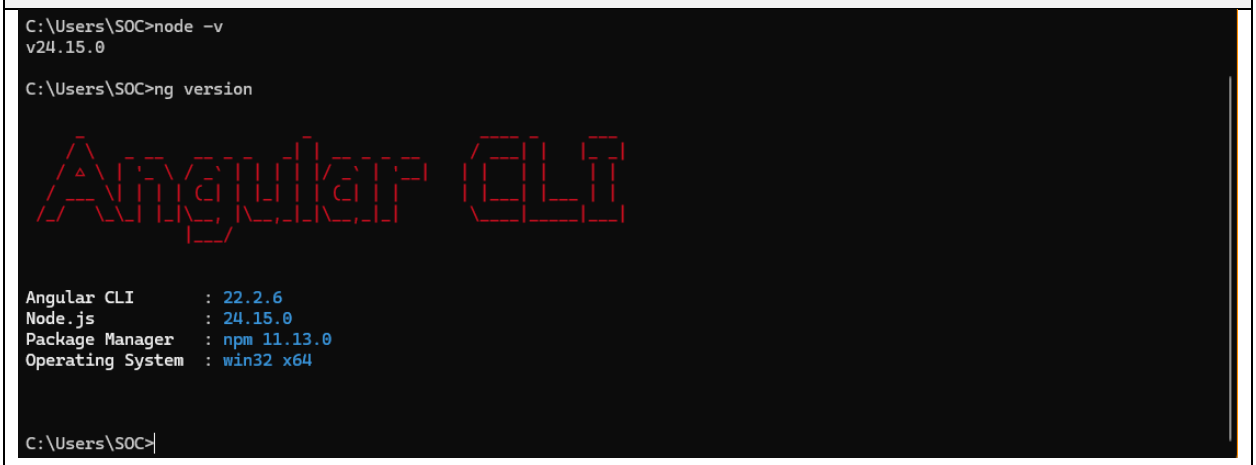

Item	Version shown on your computer
Operating system	Microsoft Windows [Version 10.0.26200.8457]
Node.js	v24.15.0
npm	11.13.0
Angular CLI	22.2.6

Screenshots

Paste each screenshot inside its box, replacing the placeholder text. Screenshots must be full and readable, and taken on your own computer.

Screenshot 1 – Environment versions

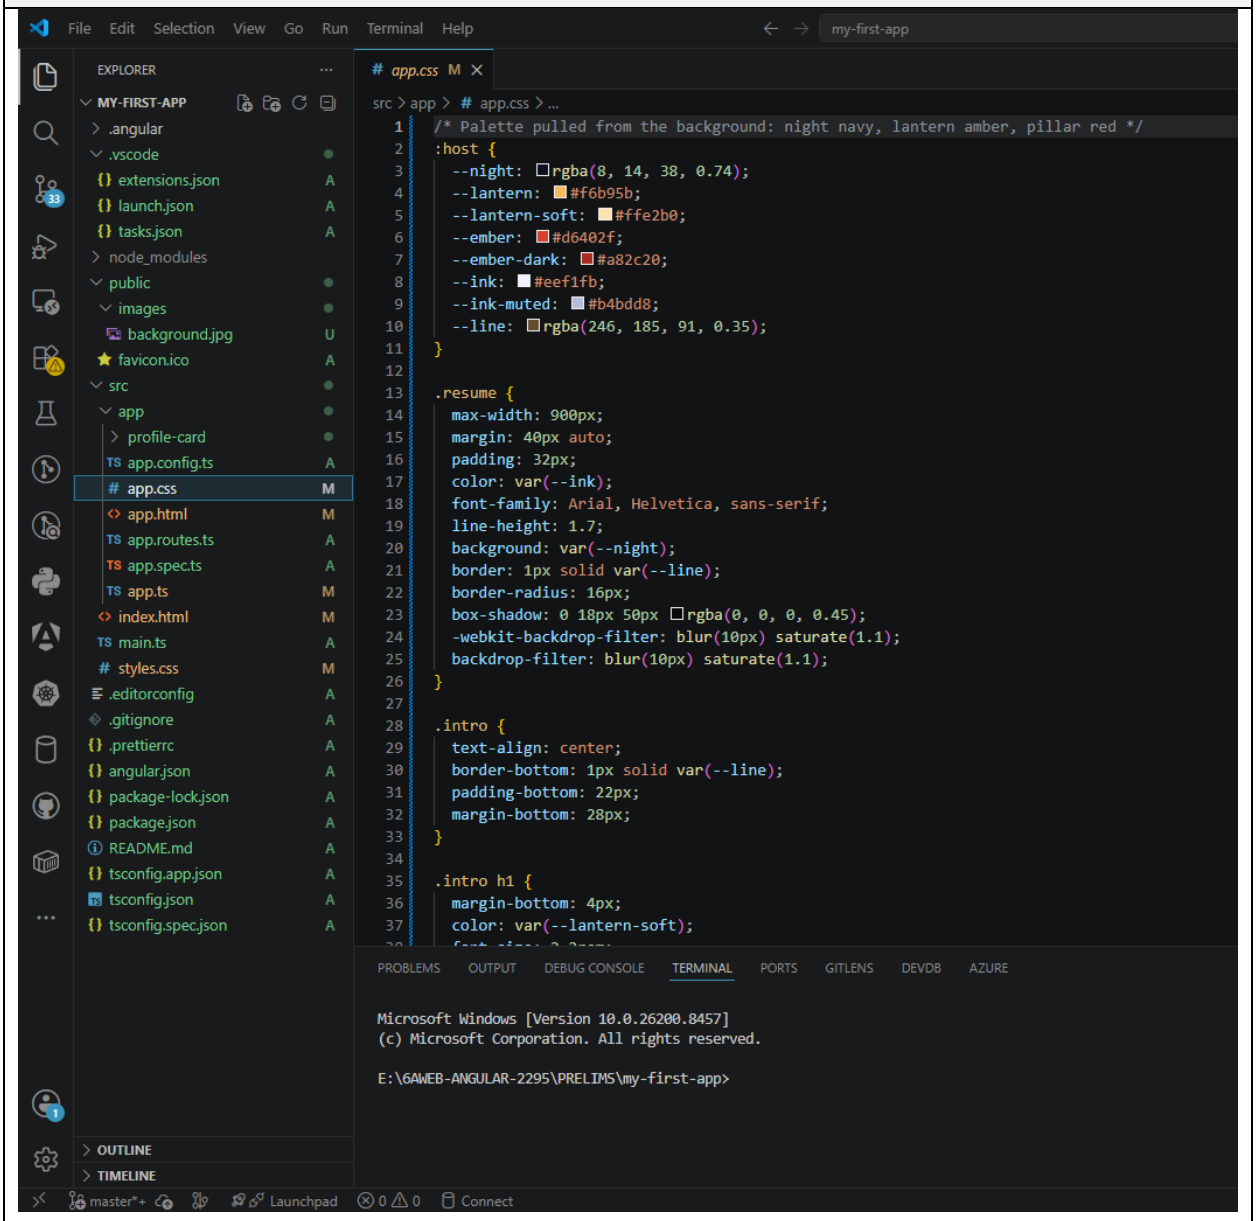

Terminal showing the output of `node -v` and `ng version` (Angular CLI 22.x must be visible)

Screenshot 2 – Project structure

VS Code Explorer showing the `my-first-app` structure with the `src/app/profile-card/` folder expanded

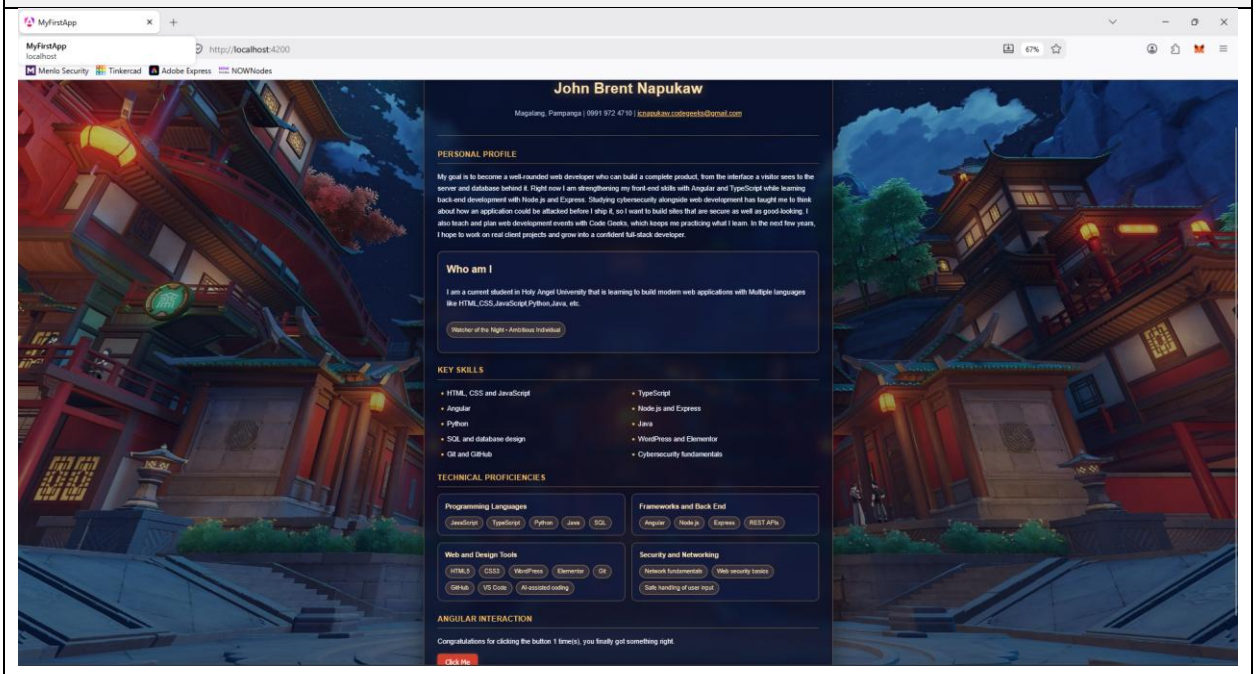

VS Code Explorer showing the `my-first-app` structure with the `src/app/profile-card/` folder expanded

Screenshot 3 – Completed profile page

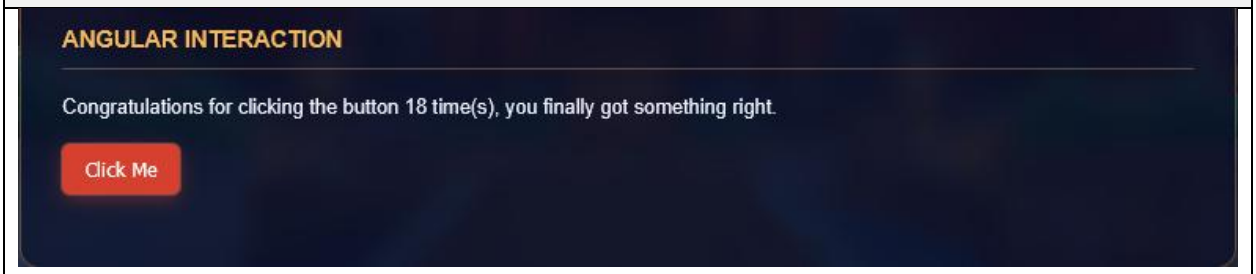

Browser at `http://localhost:4200` showing your personalized profile page, including the Profile Card

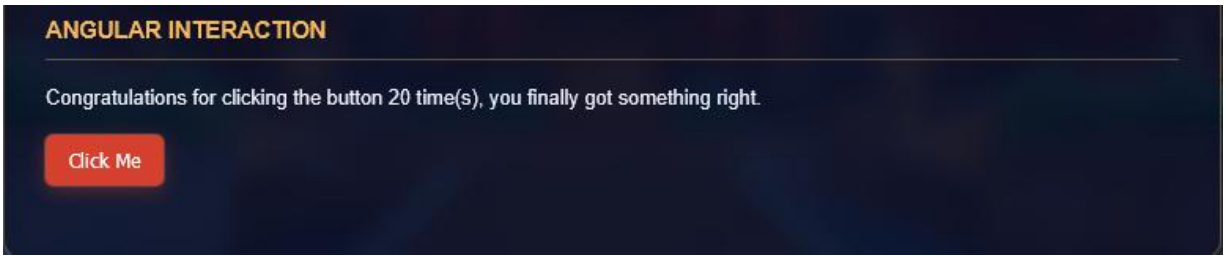

Browser at `http://localhost:4200` showing your personalized profile page, including the Profile Card

Screenshot 4 – Button interaction

Browser showing the updated message after clicking **Click Me** (for example, “You clicked the button 3 time(s).”)

Project Source Code

Upload the project as a separate ZIP file named `Lastname_Firstname_my-first-app.zip`. Tick each item before you submit.

- ✅ The ZIP contains the complete `my-first-app` folder
- ✅ The `node_modules` folder is **not** included
- ✅ `package.json` and `package-lock.json` are included
- ✅ `src/app/app.ts`, `app.html` and `app.css` contain my personalized content
- ✅ The `src/app/profile-card/` folder is included

ZIP file name uploaded: **Napukaw_John-Brent_my-first-app.zip**

Reflection Questions

Answer each question in your own words, in 3–5 sentences. Replace the placeholder under each question with your answer.

1. What is the role of the Angular CLI in creating and running an Angular application?

The Angular CLI is a command-line tool that sets up and manages Angular projects for me. I used “ng new my-first-app” to generate the project with all the needed files and settings, and ng generate component to create the Profile Card component. I run “ng serve –open” to start a local development server that rebuilds the app and refreshes the browser whenever I save a change. It also builds the app for production with ng build, so I don’t have to configure these tools myself.

2. What is the purpose of `app.ts`, `app.html`, and `app.css`?

These three files make up the main component of my app. app.ts holds the logic and data, such as my name, skills list, and the showMessage() function that runs when the button is clicked. app.html is the template that decides what appears on the page and displays the data from app.ts. app.css holds the styles for that template, such as the colors, spacing, and layout.

3. What is a standalone component, and why did you create a separate Profile Card component?

A standalone component manages its own imports instead of needing to be declared. For example, “App lists ProfileCard” in its own imports array to use it. I created a separate Profile Card component to keep the “Who am I” section in its own files. This keeps app.html shorter and easier to read, and the card could be reused elsewhere without copying code.

4. Explain the difference between interpolation, property binding, and event binding. Identify one example of each from your application.

Binding type	What it does (your explanation)	Example from your code
Interpolation	Displays a value from the TypeScript file as text in the HTML.	`{{ fullName }}` in `app.html`
Property binding	Sets an HTML element's property to a value or expression from the component.	`[href]="'mailto:' + email"` on the email link
Event binding	Runs a method in the component when the user does something, such as a click.	`(click)="showMessage()"` on the Click Me button

5. What does the `@for` block do in the Key Skills section?

The @for block repeats a piece of HTML for every item in a list. In this context, it goes through the skills array in app.ts and creates one <li> for each skill, such as "Python" and "Angular". This means I don't have to type each list item by hand. If I add or remove a skill in the array, the list on the page updates automatically. The track skill part helps Angular keep track of each item so it can update the list efficiently

.**6. What happened when you clicked the button? Explain how the event binding triggered the method.**

In this context, When I clicked the "Click Me" button, the message above it changed to "Congratulations for clicking the button 1 time(s), you finally got something right." Each click after that will make the number go up. This works because the button has (click)="showMessage()", which tells Angular to run the showMessage() method whenever the button is clicked. That method adds 1 to clickCount and updates the message text. Because the page shows {{ message }}, Angular refreshed the text on screen with the new message.

Before You Submit

- ✅ All Student Information and Environment Details fields are filled in
- ✅ All four screenshots are pasted and readable
- ✅ All six reflection questions are answered in my own words
- ✅ This document is saved as PDF: `Napukaw_John-Brent_Activity1.pdf`
- ✅ The PDF and the project ZIP are both uploaded to the Canvas assignment

Grading Criteria

Criteria	Description	Points	Score
Environment and setup	Correctly verifies Node.js, npm, and Angular CLI 22	10	
Project creation and structure	Creates and opens the Angular project; identifies key files	15	
Component implementation	Generates and correctly uses the standalone Profile Card component	30	
Design and personalization	Presents a readable, responsive page with personalized content	25	
Testing and evidence	Application runs; button works; required screenshots are provided	10	
Reflection and code submission	Answers reflection questions and submits complete source code	10	
Total		**100**	

The Score column is for the instructor. Leave it blank.
